

ONETIME LABS · BUSINESS PLAN · REVISION 1.0 · SEPTEMBER 2026

Enterprise engineering. Commercial software. Customer ownership.

OneTime Labs is a software engineering, technology consulting, and enterprise solutions company focused on solving operational problems without creating unnecessary technological dependency.

CORE PRINCIPLE

Technology should solve a problem - not automatically become another permanent subscription.

BUSINESS MODEL

Consulting + IP

Services generate near-term cash flow; software creates scalable company-owned assets.

INITIAL MARKETS

Racine · Milwaukee · Chicago

Regional business development with national remote delivery.

REVENUE ENGINES

3

Consulting, commercial software, and managed services/support.

CORE PROMISE

Build once. Own forever.

Ownership-friendly delivery without artificial dependency.

A consulting company that also builds commercial software.

The company combines near-term services revenue with long-term software intellectual property. Consulting creates cash flow and exposes repeatable operational problems; product engineering turns those repeatable problems into scalable assets.

EARLY REVENUE MILESTONE

\$25K / month

Practical operating milestone before significant permanent hiring.

POTENTIAL GROWTH CAPITAL

\$100K-\$250K

Possible range only after legal structure, valuation, and use of proceeds are defined.

Mission

Build practical technology that organizations can understand, operate, and own. OneTime Labs brings enterprise-grade architecture, engineering discipline, documentation, and operational thinking to organizations that frequently cannot justify the cost or complexity of large consulting firms and enterprise SaaS platforms.

Vision

Build three complementary businesses under a single brand: high-value consulting and engineering, commercial software, and optional managed technology services. These businesses reinforce one another: consulting identifies real problems, engineering converts repeatable problems into products, and support creates continuing customer relationships without forcing customers to rent software forever.

The market often forces organizations into two bad choices.

Buy an oversized commercial platform and pay indefinitely, or build internally without enough architecture, documentation, governance, or long-term maintainability.

The problem

Small and mid-sized organizations frequently need senior architecture, migration, asset-management, print-management, or development expertise but cannot justify a large consulting engagement or permanent senior engineering staff. Enterprise organizations face a different version of the same problem during temporary migrations and specialized projects.

The OneTime Labs approach

- Review the existing environment and define the operational problem.
- Document business and technical requirements before choosing a product.
- Use an existing commercial product when it is the correct fit.
- Engineer a purpose-built alternative when available products are too expensive, poorly matched, unnecessarily complex, or create undesirable dependency.
- Deploy, test, document, train, and transfer operational control to the customer.
- Offer continuing support only when the customer wants continuing service.

Vendor neutral

The company is not dependent on selling one vendor stack. The recommendation can follow the problem.

Ownership by design

Customer control, handoff, and documentation are part of delivery rather than an afterthought.

Enterprise discipline

Architecture, governance, testing, deployment, and documentation practices are applied without large-firm overhead.

Custom capability

When a commercial tool does not fit, OneTime Labs can build the system instead of forcing the workflow around the software.

Services built around the problem, not the product catalog.

OneTime Labs can earn revenue whether the correct answer is consulting, migration, implementation, custom development, or a OneTime Labs product.

Enterprise Consulting

Vendor migrations, systems architecture, ITAM/SAM, operational governance, modernization, documentation, and technical project leadership.

Managed Print Services

Fleet assessments, print infrastructure, PrinterLogic/Web JetAdmin administration, configuration compliance, optimization, vendor transition, and lifecycle management.

Custom Software Engineering

Internal business applications, operational dashboards, workflow systems, portals, integrations, automation, and specialized industry applications.

Commercial Software

Purpose-built OneTime Labs applications licensed through ownership-friendly perpetual or customer-controlled commercial models.

Managed Print specialization

Managed Print represents a differentiated operational capability. Potential services include print-environment assessments, fleet inventory, printer standardization, vendor transition management, print-server migration, PrinterLogic implementation, device configuration, security/compliance analysis, fleet optimization, print policy development, cost analysis, and lifecycle management.

Custom engineering delivery

Custom engagements can include architecture, interface design, database architecture, development, deployment, documentation, training, and support. A key differentiator is that customer ownership and handoff are designed into the project rather than treated as leverage for permanent dependence.

A portfolio built from real operational requirements.

Products serve two purposes: they can generate scalable revenue, and they demonstrate the company's ability to turn operational problems into working systems.

OTLES

Structured organizational documentation and engineering standards with organization, workspace, category, document, and revision hierarchy.

OTML

Purpose-built structured markup for engineering and operational documentation.

ChangeOps

Formal change requests, implementation planning, CAB governance, approvals, and audit history.

PCCR

Printer Configuration Compliance Reporting that converts fleet configuration data into measurable compliance results.

OTLAM

Flexible asset management for IT assets and other operational asset classes.

PlotMap

Operational records combined with geospatial mapping, field verification, and public-information workflows.

OneTime Labs Licensing

Shared product, customer, seat, activation, expiration, and licensing-event infrastructure.

TVM

Browser-managed venue entertainment, digital displays, trivia, and audience participation.

Tasks

Lightweight browser-based task management without enterprise project-management overhead.

Entertainment Platforms

ROFFLE, IvanSays, UnfilteredLog, and other publishing, community, streaming, and audience-interaction systems.

From local operators to enterprise transformation projects.

Initial direct sales focus is southeastern Wisconsin and northern Illinois, while engineering and consulting delivery can be national and remote.

Small + Mid-Sized Business

Organizations that need senior technical capability but cannot justify a large consulting firm or permanent senior engineering staff.

Enterprise Organizations

Specialized project work in vendor migrations, print transformation, asset management, software engineering, governance, and architecture.

Technology Partners

MSPs, vendors, recruiters, and consulting organizations requiring specialized subcontracted engineering or migration expertise.

Initial geographic markets

- Racine, Wisconsin - local SMB relationships and direct-access engineering.
- Milwaukee, Wisconsin - manufacturing, healthcare, hospitality, professional services, and technology organizations.
- Chicago, Illinois - enterprise consulting, vendor migration, corporate engineering, and partner opportunities.

Competitive position

OneTime Labs sits between large consulting firms, MSPs, SaaS vendors, and freelance developers. It can collaborate with those providers as readily as it competes with them. The differentiators are direct technical access, lower organizational overhead, vendor neutrality, ownership-friendly software, custom engineering capability, operational experience, and documentation-oriented handoff.

Recurring revenue is welcome. Artificial dependency is not.

Customers can continue paying OneTime Labs because the company continues delivering value - not because already-purchased software stops working when the invoice stops.

Revenue Line	Planning Range	Commercial Model
Consulting	\$150-\$225/hr	Hourly, daily, retainer, or fixed project
Custom development	\$5,000-\$100,000+	Milestone-based delivery
Vendor migrations	\$10,000-\$150,000+	Scoped to complexity and business impact
Commercial software	\$500-\$50,000+	Product and organization dependent
Implementation	Project based	Installation, conversion, migration, configuration, and training
Support	15%-25% of license	Optional annual support planning target
Managed services	Monthly	Hosting, monitoring, administration, and continuing service

Optional recurring services

- Technical support
- Managed hosting
- Cloud infrastructure
- Monitoring and backups
- Software maintenance and security updates
- Priority support
- Managed administration
- Feature development
- Consulting retainers

Founder-led sales first; repeatable commercial systems next.

Marketing should emphasize completed systems and operational results rather than generic “digital transformation” language.

Direct outreach

Targeted business development, local networking, LinkedIn, professional relationships, recruiters, consulting partners, MSPs, print vendors, and referrals.

Evidence-first marketing

Show the problem, the system, how it works, the architecture, and what the customer controls afterward.

Standard pipeline

Inquiry → discovery → assessment → proposal → contract → deposit → engineering → acceptance → handoff → support.

Lean operations

Avoid unnecessary office and payroll overhead. Use cloud development infrastructure and contractors before adding permanent headcount.

Project billing

Development work should generally use milestone billing. One practical planning structure is 30% at project start, 30% at design/prototype approval, 30% at production delivery, and 10% at final acceptance. Larger projects can use more granular milestones.

Operational infrastructure

- Source control
- Cloud deployment
- Database infrastructure
- Billing and invoicing
- Software licensing
- Customer administration
- Documentation
- Contract management
- Project management
- Internal engineering standards

Scale by documenting the system before scaling the team.

OneTime Labs is founder-led today, but the operating model should be designed so architecture, product knowledge, and customer delivery do not remain trapped in one person's head.

OTLES engineering standards

OTLES is intended to establish consistent practices for architecture, naming, documentation, security, database design, development, release management, change management, version control, testing, deployment, support, and system ownership. The standards are both internal operating infrastructure and commercial credibility.

Intellectual property strategy

- OneTime Labs products remain OneTime Labs intellectual property and are licensed to customers.
- Customer-specific source-code ownership is explicitly defined by contract.
- Reusable libraries, frameworks, infrastructure components, and pre-existing OneTime Labs intellectual property should normally remain with OneTime Labs unless specifically sold.
- External client projects should be clearly distinguished from OneTime Labs-owned products in portfolio presentation.

Hiring strategy

Hiring should follow sustained customer demand. Early capacity is most likely to come from contract software engineers, UI/UX design, sales/business development, support engineering, and project management. Contractors should be preferred while demand is still uneven.

Service-led at launch; progressively less dependent on founder hours.

These figures are planning assumptions for business modeling. They are not historical results or guaranteed forecasts.

Revenue	Year 1	Year 2	Year 3
Consulting & migrations	\$180,000	\$300,000	\$450,000
Managed Print / managed services	\$45,000	\$90,000	\$160,000
Software licensing	\$40,000	\$85,000	\$180,000
Custom development	\$20,000	\$45,000	\$110,000
Total Revenue	\$285,000	\$520,000	\$900,000

Operating Model	Year 1	Year 2	Year 3
Revenue	\$285,000	\$520,000	\$900,000
Direct delivery costs	\$62,700	\$130,000	\$252,000
Gross Profit	\$222,300	\$390,000	\$648,000
Operating expenses	\$145,000	\$235,000	\$375,000
Operating Profit	\$77,300	\$155,000	\$273,000

EARLY OPERATING MILESTONE

\$25K / month

Target consistent monthly revenue before more deliberate permanent hiring and product investment.

POTENTIAL GROWTH ROUND

\$100K-\$250K

Only with a specific use of proceeds and appropriate legal, capitalization, valuation, and securities work.

Capital should accelerate revenue-producing capacity, not simply increase burn.

OneTime Labs can grow through customer-funded operations, outside investment, or a combination. External capital should only be raised for a defined commercial purpose.

Potential uses of capital

- Hiring engineering capacity
- Completing commercial products
- Sales and business development
- Marketing
- Legal and intellectual-property work
- Security assessments
- Product documentation
- Infrastructure
- Customer onboarding
- Working capital

Example allocation of a \$200,000 growth round	Share
Engineering and contractors	35%
Founder / operating runway	20%
Sales and business development	15%
Product infrastructure	10%
Marketing	10%
Legal / accounting	5%
Contingency reserve	5%

Equity caution

Equity percentages should not be publicly promised until the company’s legal entity structure, capitalization, valuation, securities documentation, and investor terms have been established with qualified legal and financial professionals.

The biggest risks are commercial execution risks, not whether the company can write software.

The next phase should focus on converting engineering capability into repeatable revenue, standardized delivery, and evidence of customer value.

Risk	Issue	Mitigation
Founder dependency	Architecture, development, and sales depend heavily on one person.	Documentation, standards, reusable systems, source control, contractors, and structured delivery.
Product sprawl	Rapid engineering can create more products than the company can market.	Require commercial validation before expanding the active product portfolio.
Sales capacity	Engineering capability does not automatically produce customers.	Structured outbound sales, partnerships, referrals, and business development.
Support load	Installed products create continuing support expectations.	Standardized deployments, documentation, paid support, and clear boundaries.
Customer concentration	A large engagement can make revenue dependent on one customer.	Maintain multiple service and product revenue streams.
Legal structure	Licensing, investment, IP, and development require formal agreements.	Standard contracts and appropriate company/fundraising legal work.

Immediate priorities

- Close paying consulting engagements in vendor migration, print infrastructure, asset management, architecture, and custom software.
- Select two or three products for active commercialization instead of trying to sell everything simultaneously.
- Develop case studies that turn completed systems into evidence.
- Standardize the MSA, SOW, consulting agreement, software license, support agreement, NDA, and invoice process.
- Formalize CRM-style sales tracking for leads, opportunities, proposals, contracts, projects, and follow-ups.
- Build repeatable implementation packages so every successful delivery makes the next one easier.

Build a company that can grow without revenue increasing exactly one-for-one with founder labor.

The long-term value is the combination of enterprise operating experience, consulting revenue, reusable software, and intellectual property.

Year 1 · Commercial proof

Multiple paying consulting customers, at least one repeatable commercial software offering, standard contracts, repeatable billing, published case studies, formal engineering documentation, and predictable monthly revenue.

Year 2 · Repeatability

Software becomes a meaningful portion of revenue, engineering capacity expands beyond the founder, support and managed services create recurring revenue, and multiple products have real installations.

Year 3 · Independent business

OneTime Labs operates as a small established engineering organization with consulting, commercial software, and managed-services/support revenue engines.

Key performance indicators

- Sales: qualified leads, proposals, win rate, average contract value, sales-cycle length, and pipeline value.
- Consulting: billable utilization, hourly realization, project margin, customer-acquisition cost, and repeat engagements.
- Software: licenses sold, average license value, implementation revenue, support attachment rate, customer retention, and upgrade revenue.
- Company: monthly revenue, gross margin, operating margin, cash reserves, revenue per employee, customer concentration, recurring-service revenue, and product-revenue percentage.

POSITIONING STATEMENT

When an existing solution works, we implement it. When it does not, we build something better.

And when we build it for you, we design the relationship so you remain in control of your technology.

OneTime Labs
Build once. Own forever.
